

THE COMPLETE

CLAUDE CODE MCP MASTER GUIDE

From Netlify to Vercel · GitHub Integration · MCP Skills for Stunning AI Chatbots, Booking Systems & Payment Automation

Beginner Friendly · Step-by-Step · 2026 Edition

■ Who is this for?	Complete beginners using Claude Code in VS Code
■ What you will learn	Install MCP skills, connect GitHub → Vercel, auto-deploy
■ Time to complete	2–3 hours (setup) + ongoing reference
■ Requirements	VS Code + Claude Code extension already running

TABLE OF CONTENTS

1	Understanding MCP Skills — What They Are & Why You Need Them
2	Your Full MCP Toolkit — All Skills for Your Project
3	Installing Every Skill — Step-by-Step Commands
4	Moving from Netlify to Vercel — Complete Migration
5	Connecting GitHub to Vercel — Auto-Deploy Setup
6	Vercel MCP — Controlling Deployments from Claude Code
7	Design Skills — Making Your Chatbot Look Stunning
8	Payment, Booking & Automation Skills
9	Your Daily Workflow — From Code to Live in Seconds
10	Troubleshooting — Fixing Common Problems

CHAPTER 1

Understanding MCP Skills

What they are and why your project needs them

What is an MCP Skill?

MCP stands for Model Context Protocol. Think of it like installing apps on your phone — except instead of apps on your phone, you are installing special tools into Claude Code so it can do more powerful things for you automatically.

Without MCP skills, Claude Code can only read and write files on your computer. With MCP skills installed, Claude Code can connect to GitHub, deploy your website, query your database, browse the web, test your UI in a real browser, and much more — all without you leaving VS Code.

Why Do You Need MCP Skills for Your Project?

Your project is ambitious and covers many areas:

- A stunning website with elegant design
- An AI chatbot for conversations
- Booking and appointment scheduling
- Payment processing (Stripe etc.)
- Widget embedding on other sites
- Bot automation workflows
- Automatic deployment when you make changes

Each of these areas needs a different MCP skill. This guide covers exactly which ones to install, in what order, and how to use them.

Two Types of MCP Scope — Important to Understand

Scope	What it means	When to use it
--scope user (GLOBAL)	Skill is available in ALL your projects forever	GitHub, Memory, Fetch — tools you always want
--scope local (PROJECT ONLY)	Skill only works in the current project folder	Database, Playwright — project-specific tools

■ You can install MCP skills at ANY time — even in the middle of building your project. No need to restart anything.

CHAPTER 2

Your Complete MCP Toolkit

Every skill your project needs — explained simply

FOUNDATION SKILLS

Skill Name	What it does for your project
GitHub	Manage code, commits, pull requests from inside Claude Code
Filesystem	Read and write project files directly
Memory	Claude remembers context across all sessions
Fetch	Browse the web, read documentation, call APIs

DESIGN & UI SKILLS

Skill Name	What it does for your project
Figma MCP	Turns your Figma designs into real code automatically
Magic UI MCP	Library of stunning animated components ready to use
Playwright MCP	Tests your website in a real browser automatically

PAYMENT & BOOKING SKILLS

Skill Name	What it does for your project
Stripe MCP	Handle payments, subscriptions, invoices from Claude Code
Supabase MCP	Your database + authentication + booking storage
Qdrant MCP	AI memory for your chatbot — remembers user conversations

DEPLOYMENT SKILLS

Skill Name	What it does for your project
Vercel MCP	Deploy, monitor, and manage your live website
Sentry MCP	Catches errors on your live site and shows them in Claude

CHAPTER 3

Installing Every Skill

Step-by-step commands — copy and paste exactly

How to Open the Terminal in VS Code

Every command in this chapter is typed into the Terminal inside VS Code. Here is how to open it:

- **Step 1:** Open VS Code
- **Step 2:** Press Ctrl + ` (the backtick key, top-left of keyboard) OR go to Terminal menu → New Terminal
- **Step 3:** A black panel opens at the bottom — that is your terminal
- **Step 4:** Click inside it and type the commands below

■ **Make sure Claude Code is running in VS Code before installing skills. You should see the Claude Code chat panel open on the side.**

■■ FOUNDATION SKILLS — Install These First

GitHub MCP — Manages your code repository

```
claude mcp add github --scope user -- npx -y @modelcontextprotocol/server-github
```

■ You will also need to set your GitHub token: `export GITHUB_PERSONAL_ACCESS_TOKEN=your_token_here` (Get token from: [github.com](#) → Settings → Developer Settings → Personal Access Tokens)

Filesystem MCP — Reads and writes your project files

```
claude mcp add filesystem --scope user -- npx -y @modelcontextprotocol/server-filesystem  
/path/to/your/project
```

■ Replace `/path/to/your/project` with your actual project folder path, e.g. `/Users/yourname/myproject`

Memory MCP — Gives Claude persistent memory

```
claude mcp add memory --scope user -- npx -y @modelcontextprotocol/server-memory
```

■ No extra setup needed. Claude will now remember things between sessions automatically.

Fetch MCP — Lets Claude browse the web and read docs

```
claude mcp add fetch --scope user -- npx -y @modelcontextprotocol/server-fetch
```

■ No extra setup needed. Test it by asking Claude to 'fetch the Stripe documentation'.

■ DESIGN & UI SKILLS

Figma MCP — Converts your Figma designs to code

```
claude mcp add figma --scope user -- npx -y @GLips/figma-mcp
```

■ Set your Figma token: `export FIGMA_API_KEY=your_figma_token` (Get from: [figma.com](#) → Settings → Account → Personal Access Tokens)

Magic UI MCP — Animated premium UI components

```
claude mcp add magicui --scope user -- npx -y @magicuidesign/mcp
```

■ No extra setup. Ask Claude: 'Add a Magic UI animated hero section to my landing page'

Playwright MCP — Tests your chatbot UI automatically

```
claude mcp add playwright --scope local -- npx -y @playwright/mcp --headless
```

■ Also run: `npx playwright install chromium` This installs the test browser on your computer.

■ PAYMENT & BOOKING SKILLS

Stripe MCP — Payment processing from Claude Code

```
claude mcp add stripe --scope user -- npx -y @stripe/mcp
```

■ Set your Stripe key: `export STRIPE_SECRET_KEY=sk_test_your_key_here` (Get from: dashboard.stripe.com → Developers → API Keys)

Supabase MCP — Database, auth, and booking storage

```
# Connect via OAuth – no install needed # Go to: mcp.supabase.com and click Connect
```

■ Supabase MCP uses OAuth so there is nothing to install. Just connect your account at mcp.supabase.com

Qdrant MCP — AI memory for your chatbot

```
claude mcp add qdrant --scope local -- npx -y mcp-server-qdrant
```

■ Set connection: `export QDRANT_URL=http://localhost:6333` Or use Qdrant Cloud free tier at cloud.qdrant.io

■ DEPLOYMENT SKILLS

Vercel MCP — Deploy and manage your live site

```
claude mcp add vercel --scope user -- npx -y @vercel/mcp
```

■ Then authenticate: `vercel login` (Follow the browser prompt to log in to your Vercel account)

Sentry MCP — Catch and fix live errors automatically

```
claude mcp add sentry --scope local -- npx -y @sentry/mcp
```

■ Set your token: `export SENTRY_AUTH_TOKEN=your_token` (Get from: sentry.io → Settings → Auth Tokens)

■ After installing all skills, type `/mcp` in the Claude Code chat panel to see them all listed and confirm they are connected.

CHAPTER 4

Moving from Netlify to Vercel

Your existing project migrated in under 10 minutes

Why Vercel is Better for Your Project

Feature	Netlify (old)	Vercel (new) ■
Free deploy limit	Limited credits	Unlimited hobby deploys
Auto-deploy from GitHub	Yes	Yes (faster)
AI/Next.js optimized	Partial	Yes — built for this
Preview per branch	Yes	Yes
Edge functions	Yes	Yes (better)
MCP integration	No	Yes — control from Claude Code

Migration Steps

Step 1 Export your environment variables from Netlify

Go to Netlify Dashboard → Your Site → Site Settings → Environment Variables. Write down or screenshot all your variables (API keys, database URLs, etc.). You will need to re-enter them in Vercel.

Step 2 Create a Vercel account

Go to vercel.com and click Sign Up. Use your GitHub account to sign up — this makes connecting your repo much easier in the next chapter.

Step 3 Note your build settings from Netlify

In Netlify go to Site Settings → Build & Deploy. Note your Build Command (e.g. npm run build) and Publish Directory (e.g. dist or .next or out). You will enter these in Vercel.

Step 4 Your Netlify site can stay running

Do NOT delete your Netlify site yet. Keep it running while you set up Vercel. Only delete it after Vercel is working perfectly.

■ Your domain on Netlify will keep working until you point it to Vercel. No downtime for your users during migration.

CHAPTER 5

Connecting GitHub to Vercel

Set up auto-deploy so every code change goes live automatically

What Happens After This Chapter

Once you complete this chapter, every time you type `git push` in your terminal, Vercel will automatically build and deploy your project to the internet. You never have to manually deploy again.

Step 1 Go to vercel.com and log in

Open your browser and go to vercel.com. Click the Log In button and sign in with your GitHub account.

Step 2 Click Add New Project

On your Vercel dashboard, look for the button that says Add New... or New Project. Click it.

Step 3 Click Import Git Repository

You will see an option to import from GitHub. Click Connect GitHub if you have not already. Vercel will ask permission to access your GitHub — click Authorize.

Step 4 Select your project repository

A list of your GitHub repositories will appear. Find your chatbot/booking project and click Import next to it.

Step 5 Configure your build settings

Vercel will try to detect your framework automatically. Check that the Build Command and Output Directory match what you noted from Netlify. Common settings:

```
React: Build = npm run build | Output = build Next.js: Build = npm run build | Output =  
.next Vue: Build = npm run build | Output = dist
```

Step 6 Add your environment variables

Before deploying, scroll down to the Environment Variables section. Add every variable you wrote down from Netlify. This includes your database URL, API keys, Stripe keys, etc.

■■ Missing environment variables is the most common reason a Vercel deployment fails. Double check every single one from your Netlify list.

Step 7 Click Deploy

Click the Deploy button. Vercel will build your project for the first time. This takes 1–3 minutes. You will see a live progress log.

Step 8 Visit your new Vercel URL

When deployment finishes, Vercel gives you a URL like `yourproject.vercel.app`. Open it and test your site. If everything works, your migration is complete.

Testing Auto-Deploy Works

Now test that auto-deploy is working by making a small change:

```
# Make any small change to a file, then: git add . git commit -m "test auto deploy" git push
```

Go to your Vercel dashboard. Within 30 seconds you should see a new deployment starting. When it finishes, your change is live. Auto-deploy is working!

CHAPTER 6

Vercel MCP in Claude Code

Control your deployments without leaving VS Code

What the Vercel MCP Skill Does

Remember: GitHub → Vercel handles auto-deploy automatically. The Vercel MCP skill is an extra layer that lets you talk to Claude Code and control Vercel with words. Think of it as your deployment assistant.

Tell Claude Code...	What happens
"Deploy my project to Vercel"	Manually triggers a deployment
"Check why my last deployment failed"	Shows build logs and error details
"Add STRIPE_KEY as an environment variable"	Set a new env variable without going to dashboard
"Create a preview deployment for my bookshelf app"	Makes a test URL for a specific branch
"Show me the status of my latest deployment"	Real-time build status
"Roll back to my previous deployment"	Undoes a broken deployment instantly

CHAPTER 7

Design Skills for a Stunning UI

Make your chatbot and booking site look world-class

The Design Workflow with MCP

With the Figma MCP and Magic UI MCP installed, your design-to-code pipeline becomes almost automatic. Here is how a typical design session works:

Step	Tool	What you do
1	Figma	Design your chatbot UI in Figma (colors, layout, components)
2	Figma MCP	Claude Code reads your Figma file and generates the exact code
3	Magic UI MCP	Add animations, hover effects, smooth transitions with one sentence
4	Claude Design	Fine-tune the overall look using Claude's built-in design tool
5	Playwright MCP	Automatically tests the UI in a real browser to catch visual bugs

Example Claude Code Prompts for Stunning Design

```
"Create an elegant dark-mode booking form with gold accents and smooth animations"
"Add a Magic UI animated gradient background to my hero section"
"Make the chatbot widget appear with a slide-up animation from the bottom right"
"Use my Figma design at [figma-url] to build the appointment calendar component"
"Run Playwright tests on the booking flow and show me any visual errors"
```

CHAPTER 8

Payment, Booking & Automation

Stripe payments, appointment scheduling, and AI memory

Stripe MCP — Taking Payments

The Stripe MCP lets Claude Code help you build and manage your payment system. Once installed and your Stripe key is set, you can ask Claude to create payment flows, set up subscriptions, and handle webhooks.

```
claude mcp add stripe --scope user -- npx -y @stripe/mcp export
STRIPE_SECRET_KEY=sk_test_your_key_here
```

"Create a Stripe payment form for event bookings at \$49"

"Set up a monthly subscription plan for premium members"

"Handle the Stripe webhook for successful payment and update the booking in Supabase"

Supabase MCP — Booking & Database

Supabase is your all-in-one backend. It handles storing bookings, user accounts, appointment slots, and more. The MCP lets Claude Code read and write your database with simple English commands.

```
# Connect via browser – no terminal install needed # Go to: mcp.supabase.com → Click
Connect → Authorize
```

"Create a bookings table with columns: id, user_id, event_name, date, status"

"Show me all bookings for tomorrow sorted by time"

"Update booking #123 status to confirmed and send a confirmation email"

"Create a function that prevents double-booking the same time slot"

Qdrant MCP — AI Chatbot Memory

Qdrant is a vector database that gives your AI chatbot long-term memory. It remembers what each user discussed, their preferences, past bookings, and can suggest relevant events. This is what makes your chatbot feel premium.

```
claude mcp add qdrant --scope local -- npx -y mcp-server-qdrant export
QDRANT_URL=http://localhost:6333
```

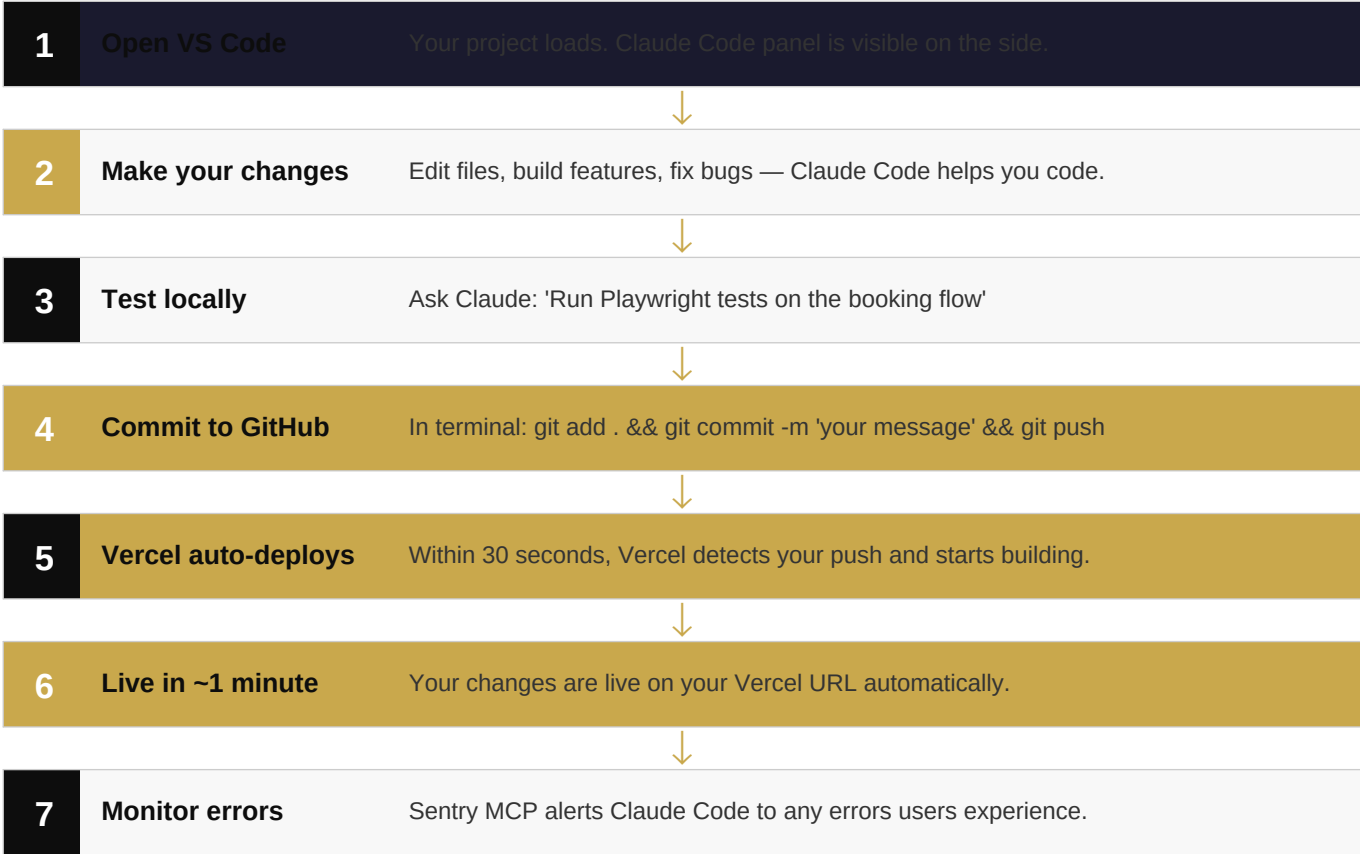

■ For a production chatbot, use Qdrant Cloud (cloud.qdrant.io) free tier instead of running it locally. This keeps your chatbot memory alive even when your computer is off.

CHAPTER 9

Your Daily Development Workflow

From writing code to live website in under 60 seconds

Your Complete Workflow After Setup

The Key Git Commands You Will Use Every Day

```
git add . git commit -m "describe what you changed" git push
```

That is all you need to type. Vercel handles everything after git push automatically.

■ Write clear commit messages like 'add payment form' or 'fix booking calendar bug' so you can find changes later.

CHAPTER 10

Troubleshooting Common Problems

Fix issues quickly and keep building

■ MCP skill shows as disconnected after installing

■ Type `/mcp` in the Claude Code chat panel to refresh connections. If still disconnected, close and reopen VS Code. The skill will reconnect automatically.

■ Vercel deployment failed — build error

■ In your Vercel dashboard, click on the failed deployment and read the build log. The error is almost always a missing environment variable or a package that needs installing. Ask Claude Code: 'Fix my Vercel build error: [paste the error]'

■ git push says 'remote: Repository not found'

■ Your GitHub MCP token may have expired. Run: `export GITHUB_PERSONAL_ACCESS_TOKEN=your_new_token`. Get a new token from [github.com](https://github.com/settings/tokens) → Settings → Developer Settings → Personal Access Tokens.

■ Supabase MCP says unauthorized

■ Your Supabase OAuth session expired. Go back to mcp.supabase.com and reconnect your account. This happens every few weeks.

■ Stripe payments not working on live site

■ Check that you added your LIVE Stripe key (`sk_live_...`) in Vercel environment variables, not your test key (`sk_test_...`). Test keys only work in development.

■ Chatbot forgets previous conversations

■ Make sure Qdrant is running. If using local Qdrant, it stops when your computer restarts. Switch to Qdrant Cloud free tier for persistent chatbot memory.

■ Claude Code does not see my new MCP skill

■ After installing any new MCP skill, type `/mcp` in the chat panel to refresh. If the skill still does not appear, restart VS Code completely.

■ My Netlify site went down during migration

■ Do not delete your Netlify site until Vercel is fully working. You can run both at the same time. Only update your domain to point to Vercel after testing everything.

Getting More Help

Resource	URL	Best for
Claude Code Docs	docs.claude.com	Official MCP and Claude Code guides
Vercel Docs	vercel.com/docs	Deployment settings and environment variables
Supabase Docs	supabase.com/docs	Database setup and booking tables
Stripe Docs	stripe.com/docs	Payment integration guides
