

CLAUDE CODE

Master Build Guide

● 10-Page Beginner to Pro Guide ● No Coding Experience Needed ● Claude Code Pro

Website:	habeshaevents.netlify.app
Goal:	Replace broken n8n chat widget with a new Claude Code powered AI booking agent
Skill Level:	Complete Beginner — Claude Code does all the coding
Tools:	Claude Code · Anthropic API · CallMeBot WhatsApp · Gmail SMTP · Netlify
What Changes:	Only the chat widget — website design stays exactly the same
What Stays Same:	All pages, colours, fonts, images, content — untouched

CHAPTER 1

What is Claude Code & Why It Will Fix Your Problem

Claude Code is a powerful AI coding tool that runs in your computer's terminal (command line). You type instructions in plain English and Claude Code reads your website files, understands your entire project, writes new code, edits existing files, and fixes bugs — all automatically. You never need to write a single line of code yourself.

Why n8n Was Failing For You:

- **n8n free tier** has execution limits — after a certain number of runs, it stops working and returns 500 errors.
- **CORS errors** — n8n free tier does not allow cross-origin requests from external websites properly.
- **Timeout issues** — n8n free tier has slow response times that cause the chat widget to time out.
- **Webhook URL instability** — free tier webhooks sometimes go offline without warning.

What Claude Code Will Build Instead:

Claude Code will build a self-contained chat widget that talks directly to the Anthropic API (Claude AI) — no n8n, no webhooks, no third-party services that can fail. Everything runs cleanly inside your own website.

OLD SYSTEM (Broken)	NEW SYSTEM (Claude Code)
Website → n8n webhook → OpenAI → back	Website → Anthropic API directly
Depends on n8n free tier (unreliable)	Uses your Claude Code Pro subscription
CORS errors from n8n	No CORS — same-origin API calls
500 errors when n8n limit reached	No limits — direct API connection
Complex 8-node n8n workflow	Clean single component file

CHAPTER 2

Installing Claude Code on Windows

Claude Code runs in the terminal (command line). You need to install two things first: Node.js (required to run Claude Code) and then Claude Code itself. Follow every step exactly — do not skip any.

STEP 2A Install Node.js (Required First)

- ✓ Go to **nodejs.org** in your browser.
- ✓ Click the big green button that says '**LTS**' (Long Term Support) — this downloads the installer.
- ✓ **Important:** Do NOT download version 25 or higher — download version **20 or 22 LTS**.
- ✓ Run the downloaded installer (.msi file). Click Next → Next → Install → Finish.
- ✓ To verify: Press **Windows key + R**, type **cmd**, press Enter. In the black window type: **node --version**
- ✓ You should see something like: v22.0.0 — this confirms Node.js is installed correctly.

STEP 2B Install Claude Code

- ✓ In the same black command window, type exactly: **npm install -g @anthropic-ai/claude-code**
- ✓ Press Enter and wait — it will download and install (takes 1-2 minutes).
- ✓ When finished, type: **claude --version** to confirm it installed.
- ✓ You should see a version number like: 1.x.x
- ✓ Now type: **claude** and press Enter — it will ask you to log in.
- ✓ Log in with your **Anthropic account** (the same account with your Claude Code Pro subscription).
- ✓ After login you will see: **Welcome to Claude Code!** — installation is complete.

■ PRO TIP

Pin the terminal to your taskbar for easy access. Right-click the cmd window in your taskbar → 'Pin to taskbar'. You will use it every time you work with Claude Code.

CHAPTER 3

Opening Your Website Project in Claude Code

Before Claude Code can help you, it needs to be opened inside your website project folder. This is called 'navigating to your project'. Think of it like opening a book before reading it.

STEP 3A Download Your Website from Netlify

✓

Go to **netlify.com** and log in to your account.

✓

Click on your **habeshaevents** site.

✓

Go to **Deploys** tab → find your latest deploy → click '**Download deploy**' or go to your GitHub/source.

✓

If your site was built with Manus AI, go back to Manus AI and download the latest ZIP of your project.

✓

Extract the ZIP to a folder on your Desktop. Name it: **habesha-website**

✓

You should see folders like: **src/**, **public/**, **package.json** inside it.

STEP 3B Open the Project in Claude Code

✓

Open your terminal (cmd or PowerShell).

✓

Type: **cd Desktop\habesha-website** and press Enter. (This navigates into your project folder)

✓

Type: **dir** and press Enter. You should see your project files listed.

✓

Now type: **claude** and press Enter.

✓

Claude Code opens inside your project — it can now read and edit all your website files.

✓

You will see a prompt like: **habesha-website \$** — you are now inside Claude Code!

■ IMPORTANT

Always open Claude Code FROM INSIDE your project folder. If you open it from the wrong folder, it cannot see your website files and will make mistakes.

How Claude Code Reads Your Project:

WHAT CLAUDE CODE READS	WHY IT MATTERS
src/ folder	All your React components and pages
package.json	Your project dependencies and scripts
CLAUDE.md (you will create this)	Your specific instructions for Claude
.env file	Your API keys stored securely
public/ folder	Static assets like images

CHAPTER 4

The CLAUDE.md File — Teaching Claude Your Website

CLAUDE.md is a special file you create in your project folder. It tells Claude Code everything important about your website — what to protect, what to change, your API keys locations, your brand colours, and your rules. Think of it as giving Claude a briefing before starting work.

Create This File Right Now:

In your terminal, type: **claude** to open Claude Code, then give this first order:

Create a file called CLAUDE.md in the root of this project with the following content exactly as written.

Copy This Exact CLAUDE.md Content:

```
# Habesha Celebration Events – Claude Code Instructions

## About This Project
This is the Habesha Celebration Events website hosted at habeshaevents.netlify.app
Built with React + Vite. Deployed to Netlify by dragging the dist/ folder.

## CRITICAL RULES – READ BEFORE EVERY TASK
1. NEVER change any website design, colours, fonts, images, or layout
2. NEVER modify any existing page content or text
3. NEVER change App.jsx structure except to add/remove the chat widget import
4. ONLY work on the chat widget component and its related files
5. ALWAYS preserve the existing Tailwind classes and styling

## Brand Colours
Primary Gold: #C9A84C | Dark Background: #0D0D1A | Light: #F5F0E8

## Business Information
Business: Habesha Celebration Events, Johannesburg, South Africa
AI Agent Name: Ayana
WhatsApp: 27781500968 (CallMeBot API key: 1554406)
Gmail: habeshacelebrationevents@gmail.com

## Build Command
npm install --legacy-peer-deps && npm run build
Output folder: dist/ (drag to Netlify to deploy)

## What Needs Building
A chat widget that: talks to Anthropic API directly, collects 7 booking fields,
sends WhatsApp via CallMeBot, sends email via EmailJS or similar.
```

CHAPTER 5

How to Give Orders to Claude Code (The Right Way)

The quality of Claude Code's work depends entirely on how clearly you give instructions. This chapter teaches you the exact method to get perfect results every time — called the SAFE-SPECIFIC-SEQUENTIAL method.

The 3 Rules of Giving Good Orders:

RULE	WHAT IT MEANS	EXAMPLE
1. SAFE	Always say what NOT to touch first	'Do not change any existing files except...'
2. SPECIFIC	Tell exactly what to build, every detail	'Build a chat widget with gold button, dark background...'
3. SEQUENTIAL	Do one task at a time — never combine big tasks	Do removal first, then build, then connect'

Order Structure Template (Use This Every Time):

CONTEXT: [Tell Claude what your project is]

PROTECTION: Do not change [list what to protect]

TASK: [Exactly what to build or fix]

DETAILS: [Specific requirements, colours, API URLs]

OUTPUT: [What files should be created or changed]

Good vs Bad Order Examples:

■ BAD ORDER	■ GOOD ORDER
Fix my chat widget	Do not change any existing files. Only create src/components/AyanaChat.jsx — a floating chat widget v
Add WhatsApp	After the booking is complete (all 7 fields collected), send a GET request to https://api.callmebot.com/w
Make it work	The widget reads the AI reply from response.content[0].text and displays it in the chat window.

■ PRO TIP

Always end your order with: 'Show me the complete file content before making any changes.' This lets you review what Claude will do before it touches your code.

CHAPTER 6

Order 1 — Remove the Broken n8n Widget Safely

Before building the new widget, you must safely remove the old broken n8n widget. This must be done carefully so the website design is not affected.

STEP 6 Give This Exact Order to Claude Code

- ✓ Open Claude Code inside your project folder (type **claude** in terminal).
- ✓ Copy and paste the order below exactly as written.
- ✓ Press Enter and wait for Claude Code to respond.
- ✓ Read the response carefully — Claude will tell you what it found and what it plans to change.
- ✓ Type **yes** to confirm each change only after reading it.
- ✓ After completion, type **npm run build** to make sure the project still builds without errors.

Conv This Order Into Claude Code:

I have a React website for Habesha Celebration Events. I need you to safely remove an existing broken chat widget that was connected to n8n. Here is what to do:

PROTECTION: Do not change any page designs, colours, fonts, images, navigation, or any content on any page. Do not modify App.jsx structure except to remove the chat widget import and component tag.

TASK: Find and remove the broken chat widget by:

1. Search all files in src/ for any file that contains 'n8n' or 'webhook' or 'callmebot' or 'HabeshaChatWidget'
2. Tell me the exact filename and location of each file found
3. Remove the import line from App.jsx for that widget
4. Remove the component tag from App.jsx for that widget
5. Delete the widget component file
6. Do not delete any other files

Before making any changes, show me exactly what you found and what you plan to change.

■ **SAFETY** When Claude Code shows you what it found — read it carefully. If it mentions any file you don't recognise, type 'skip that file' before saying yes.

CHAPTER 7

Order 2 — Build the New AI Booking Agent

Now Claude Code will build a brand new chat widget that connects directly to the Anthropic API. No n8n, no webhooks, no external services that can fail. Pure, clean, reliable.

First — Get Your Anthropic API Key:

STEP 7A Get Your Anthropic API Key

- ✓ Go to **console.anthropic.com** and log in.
- ✓ Click '**API Keys**' in the left menu → '**Create Key**'.
- ✓ Name it: **Habesha Website**. Copy the key (starts with sk-ant-).
- ✓ In your project folder, find or create a file called **.env**
- ✓ Add this line: **VITE_ANTHROPIC_API_KEY=sk-ant-your-key-here**
- ✓ Save the file. This keeps your API key secure and out of your code.

Now Give This Build Order to Claude Code:

I need you to build a new AI booking chat widget for Habesha Celebration Events website.

PROTECTION: Do not change any existing files except App.jsx (only to add import and component tag). Do not change any colours, fonts, layouts, or page content anywhere.

CREATE: src/components/AyanaBookingChat.jsx

WIDGET REQUIREMENTS:

- Floating button bottom-right corner, gold colour #C9A84C, chat bubble icon
- Chat window: dark background #0D0D1A, gold accents, branded as 'Ayana'
- Connects to Anthropic API at <https://api.anthropic.com/v1/messages>
- Uses model: claude-haiku-4-5-20251001 (fast and cheap)
- API key from: import.meta.env.VITE_ANTHROPIC_API_KEY
- Sends full conversation history with each request
- Shows typing animation while waiting for reply
- Welcome message: Selam! I am Ayana from Habesha Celebration Events. How can I help you?

SYSTEM MESSAGE for the AI (include this exactly in the API call):

You are Ayana, booking assistant for Habesha Celebration Events, Johannesburg South Africa. Collect: 1.Full name 2.Phone 3.Email 4.Event type 5.Date 6.Guest count 7.Special requests. Ask 1-2 questions at a time. When all 7 collected say BOOKING_COMPLETE: followed by summary.

ADD to App.jsx: import AyanaBookingChat and add component tag before closing div.

CHAPTER 8

Order 3 — Connect WhatsApp & Gmail Notifications

After the AI collects all 7 booking details and says `BOOKING_COMPLETE`, the widget must automatically send a WhatsApp notification to your phone and an email to your Gmail. This is done using free APIs that work directly from the browser.

Give This Order to Claude Code:

Update `src/components/AyanaBookingChat.jsx` to add booking notifications.

PROTECTION: Only edit `AyanaBookingChat.jsx`. Do not touch any other file.

TASK: When the AI response contains the text `BOOKING_COMPLETE`, automatically:

1. WHATSAPP NOTIFICATION via CallMeBot:

Send a GET fetch request to:

`https://api.callmebot.com/whatsapp.php?phone=27781500968&apikey;=1554406&text;=ENCODED_MESSAGE`

The text should be URL-encoded and contain: New Habesha Booking! followed by the full summary

2. EMAIL NOTIFICATION via EmailJS:

Install `emailjs-com` package and send email with:

- To: `habeshacelebrationevents@gmail.com`
- Subject: New Booking Request – Habesha Celebration Events
- Body: The full `BOOKING_COMPLETE` summary from the AI response

3. Show the user a confirmation message: Thank you! Your booking request has been received. Our team will contact you within 24 hours.

Also add error handling – if WhatsApp or email fails, still show the confirmation to the user.

EMAILJS SETUP

After Claude builds the code, go to `emailjs.com` → sign up free → create a service connected to your Gmail → get your Service ID, Template ID and Public Key → tell Claude Code to add those values to your `.env` file.

CHAPTER 9

Testing, Building and Deploying to Netlify

After Claude Code finishes building, you need to test it locally first, then build the production version and deploy it to your live Netlify website.

STEP 9A Test Locally First

- ✓ In your terminal (inside the project folder) type: **npm install --legacy-peer-deps**
- ✓ Wait for it to finish, then type: **npm run dev**
- ✓ Open your browser and go to: **http://localhost:5173** (or the URL shown in terminal)
- ✓ You should see your website exactly as before — with the new gold chat button bottom-right.
- ✓ Click the chat button — the Ayana chat window should open.
- ✓ Type: **Hello** — Ayana should reply within 2-3 seconds.
- ✓ Have a full conversation until you get **BOOKING_COMPLETE**.
- ✓ Check your WhatsApp phone — you should receive a notification.
- ✓ Check **habeshacelebrationevents@gmail.com** — booking email should arrive.

STEP 9B Build and Deploy to Netlify

- ✓ Press **Ctrl+C** in terminal to stop the local server.
- ✓ Type: **npm run build** and press Enter.
- ✓ Wait for the build to complete — you will see: **dist/ folder created successfully**
- ✓ Open **File Explorer** and navigate to your project folder.
- ✓ Find the **dist/** folder inside it.
- ✓ Go to **netlify.com** → log in → click your habeshaevents site.
- ✓ Go to **Deploys** tab → drag the entire **dist/** folder onto the deploy area.
- ✓ Wait 30 seconds for deploy to complete — your live site is now updated!
- ✓ Visit **habeshaevents.netlify.app** and test the chat widget on the live site.

- **IF BUILD FAILS** Tell Claude Code exactly: 'The build failed with this error: [paste error]. Fix it without changing any design or existing components.' Claude will fix it automatically.

CHAPTER 10

Master Prompts, Pro Tips & Troubleshooting

This final chapter gives you the master prompts for every situation, pro tips for getting the best from Claude Code, and a troubleshooting guide for every common problem.

Master Prompt Library:

SITUATION	EXACT PROMPT TO USE
Widget not showing	Only edit App.jsx — find where AyanaBookingChat is imported and used. If missing, add: import AyanaBookingChat
AI not replying	Only edit AyanaBookingChat.jsx — the Anthropic API fetch is failing. Check the fetch URL is https://api.anthropic.co
WhatsApp not sending	Only edit AyanaBookingChat.jsx — fix the CallMeBot fetch. The URL must be: https://api.callmebot.com/whatsapp.
Build error	The build failed with this error: [PASTE ERROR HERE]. Fix it without changing any design, colours, or existing com
Design changed	You changed the website design which I told you not to. Please revert all changes to [filename] to exactly what it wa

Pro Tips for Using Claude Code:

- **Always start a session by typing:** 'Read CLAUDE.md first before doing anything.' This reminds Claude of your rules.
- **Use /undo command** if Claude makes a mistake — type /undo in Claude Code to reverse the last change.
- **Ask to see files before editing:** 'Show me the current content of App.jsx before making any changes.'
- **Test after every change:** Run npm run dev after each Claude Code task to catch problems early.
- **One task at a time:** Never ask Claude to do 3 things at once. Break it into separate orders.
- **Save working versions:** After each successful step, copy your src/ folder to a backup location.

Final Go-Live Checklist:

✓	Node.js v20 or v22 installed — confirmed with node --version
✓	Claude Code installed — confirmed with claude --version
✓	Logged into Claude Code with your Pro subscription account
✓	CLAUDE.md file created in project root with all business details
✓	.env file created with VITE_ANTHROPIC_API_KEY value
✓	Old n8n widget removed from src/components/ and App.jsx
✓	AyanaBookingChat.jsx created and imported in App.jsx
✓	Local test passed — Ayana replies to Hello in browser
✓	BOOKING_COMPLETE test passed — all 7 fields collected correctly
✓	WhatsApp notification received on 27781500968
✓	Gmail email received at habeshacelebrationevents@gmail.com
✓	npm run build completed without errors
✓	dist/ folder deployed to Netlify successfully

Live site tested at habeshaevents.netlify.app — chat works perfectly

You Are Now a Claude Code Builder! ■

Your Habesha Celebration Events website now has a professional AI booking agent built with Claude Code — no more n8n errors, no more 500 errors, no more missed bookings. Ayana works directly with the Anthropic API, reliably, 24 hours a day.
